Noah Smith

Requires 5-10 minutes to set up

Tested up to: Java16, Angular15, Bootstrap4.6, mySQL8.0.3.2

Provides streamlined human resources management system that provides ease of access for users to quickly complete work from one place.

Description

The system was created to be a simpler employee management system to provide ease of access to individuals who work in HR. This system will help to prevent redundancy in the database by providing unique employee ID's to individuals and decrease the amount of information that needs to be required of them. To start the program open the application.java file in the java and start the program to allow Spring boot to start providing information. Import the front-end framework into Visual Studio Code. At the bottom of the window pull of the terminal and type in "ng serve" to allow angular to begin transmitting. Angular will transmit to "http;//localhost:3200 on your local browser. You will be able to view the UI so long as the front and back end are running simultaneously.
